CONTENTS

1. Introduction:

Phishing is a form of fraud in which the attacker tries to learn sensitive information such as login credentials or account information by sending as a reputable entity or person in email or other communication channels. Phishing attacks can paralyze a business. Staff might be unable to continue their work. Data and assets might be stolen or damaged. Customers might be unable to access online services. The reason security defenders struggle to detect phishing domains is because of the unique part of the website domain.

1.1 Project Overview:

Category: Applied Data Science

Team ID : PNT2022TMID44232

Skills Required:

IBM Cloud, IBM Watson Studio, Data Science, Machine learning, HTML,CSS, Javascript, IBM Cloud Object Storage, Python- Flask

Project Description:

Phishing is a form of fraudulent attack where the attacker tries to gain sensitive information by posing as a reputable source. In a typical phishing attack, a victimopens a compromised link that poses as a credible website. The victim is then asked to enter their credentials, but since it is a “fake” website, the sensitive information is routed to the hacker and the victim gets “hacked.”

Phishing is popular since it is a low effort, high reward attack. Most modern web browsers, antivirus software and email clients are pretty good at detecting phishing websites at the source, helping to prevent attacks. To understand how they work, this project shows you how to build your own phishing URL detector using Pythonand

Applied data science:

1.Identify the criteria that can recognize fake URLs

2.Build a decision tree that can iterate through the criteria 3.Train our model to recognize fake vs real URLs 4,Evaluate our model to see how it performs

5.Check for false positives/negatives

Social Impact:

• It will help to minimize the frauds while using software solutions(EX: Web applications, etc).

Business Model/Impact:

This application can be used by many E-commerce enterprises in order to make the whole transaction process.

1.2Purpose:

There are a number of users who purchase products online and make payments through e-banking. There are e-banking websites that ask users to provide sensitive data such username, password & credit card details, etc., often for malicious reasons. This type of banking website is known as a phishing website.

Web service is one of the key communications software services for the Internet. phishing is one of many security threats to web services on the Internet.

Common threats of web phishing:

- Web phishing aims to steal private information, such as usernames, passwords, and credit card details, by way of impersonating a legitimate entity.
- It will lead to information disclosure and property damage.
- Large organizations may get trapped in different kinds of scams.

2.LITERATURE SURVEY:

1. WEB ADDRESS BASED EVALUATION

1.1. LIST BASED DETECTION TECHNIQUES

A database of URL called list is maintained. It generally holds URLs, internet protocol (IP) addresses, and keywords. Some researchers maintain a whitelist, which is a collection of legitimate URLs. Most of the researchers suggest maintaining a blacklist, which is acollection of malicious URLs. List-based detection method acts as a filtering mechanism to sweep away suspicious webpages before entering into the detection process

SI. NO	TITLE OF PAPER	YEAR OF PUBLICATION	AUTHOR NAME	DESCRIPTION
1	Anti-phishing based on automated individual white-list	2008	Cao Y. Han W. Le Y.	He proposed an automated individualwhitelist (AIWL)-basedapproach that maintains alocal list of user's familiarlogin user interface (LUI)of websites to alert theuser whenever he tries to access an unfamiliarwebsite with LUI. AIWL uses a naïve Bayesianclassifier to maintain the list by adding the unknown website.However, This approach cannot stand up against the local machine trojan horse and viruses.
2	A novel approach to protect against phishing attacks at client side using auto-updated white-list	2016	Jain A.K. Gupta B.B	It combined the whitelist approach with heuristicsand ML to propose the auto-updated whitelist. Blacklists and whitelists are used as a filteringmodule in many web phishing detection approaches to reduce the processing time wasted on pre-processing, feature extraction, and soon.

1.1. HEURISTICRULE BASED DETECTION TECHNIQUE

Heuristic rule-based techniques can identify the zero- day attacks. Therefore, it has a high-detection rate than list-based phishing detection schemes. The performance and accuracy of the technique wholly depend on the heuristics applied

SI. NO	TITLE OF PAPER	YEAR OF PUBLICATION	AUTHOR NAME	DESCRIPTION

	1	Machine learning based phishing detection from URLs	2019	Sahingoz O.K. Buber E. Demir O. et al	Applies heuristics to extract natural language processing (NLP) features from the URL to detect the URL-based web phishing attacks. The heuristics are derived based on parameters such as raw word count, short word length, Alexa ranking, similar brand	

				name count, etc.
2	'A stacking model using URL and HTML features for phishing webpage detection	2019	Li Y. Yang Z. Chen X. et al	Applies some heuristics on the URL to verify abnormalities such as suspicious symbols (e.g. @, _), https, URL length information, number of dots in a domain name, sensitive vocabulary, and top-level domain.
3.	Intelligent phishing URL detection using association rule mining	2016	Jeeva S.C. Rajsingh E.B.	Computes 14heuristics: length of the host URL, number of slashes, dots in the host name, number of terms in the host name, special characters, IP address, unicode in URL, transport layer security, subdomain, certain keyword, top-level domain, number of dots in the path of the URL, hyphen in the host name and URL length. The extracted features are then fed into associative rule miningalgorithms.

4	A phish detector using light weight search features	2016	Varshney G.Misra M..Atrey P.K	Proposed a lightweight phish detector, which extracts the domain name of the URL and title of the webpagewhenever a user accessing a website. The extracted URL domain name and the title page aresearched using a search engine to determine the legitimacy

1.2. LEARNING BASED DETECTION TECHNIQUE

Learning algorithms such as ML and deep learning are used to detect the attacks based on the features extracted from the URL. In learning-based web phishing detection, the statistical features and NLP features of the URLs are extracted and fed into ML algorithms such as support vector machine (SVM), decision tree, naïve Bayes algorithm, random forest etc. The classifier creates a model based on the inference extracted from

the Train Sl. NO	ing samples. The suspicious TITLE OF PAPER	URL is evaluated base YEAR OF PUBLICATION	don the model AUTHOR NAME	built by the classifier. DESCRIPTION
1	Machine learning based phishing detection from URLs	2019	Sahingoz O.K. Buber E. Demir O. et al.	Practices seven different ML algorithms such as naive Bayes, random forest,k-nearest Neighbour(KNN),Ada bo ost,kstar, ,sequential minimal optimization, and decision tree on the extractedfeatures from the URLand analysed the best performance amongthem.

2	'A stacking model using URL and HTML features for phishing webpage detection	2019	Li Y. Yang Z. Chen X. et al.:	Proposed a deep learningapproach to extract thefeatures naturally from the URLs and to detectthe web phishing attack. Convolutional neural network(CNN) is used to extract the correlation features and long short term memory (LSTM) network is used to learn sequential dependency.
3	Phishing websit e detection based on multidimensional features driven by deep learning	2019	Yang P. Zhao G. Zeng P: '.	Proposed aweb phishing detection approach usinga neural network. In thiswork, feature validity value(FVV) is introduced to examine the effect ofoptimal features. By using the FVV index, the optimal featureselection algorithm is designed to choose the optimalfeatur es and is used to mitigate the over fitting problem of neural networks.

ML algorithms can detect zero-day attacks and have a shorter detection time. However this technique is feature sensitive and the performance varies based on the characteristics of the ML algorithm applied

2. WEBPAGE CONTENT\ SIMILARITY BASED EVALUATION

2.1. HEURISTIC RULE BASED WEBPAGE SIMILARITYEVALUATION

In heuristic-based webpage similarity calculation, keywords and features are extracted from the suspicious webpage

and verified against the targeted webpage using search methods to enable a secured environment against phishing scams.

SI. NO	TITLE OF PAPER	YEAR OF PUBLICATION	AUTHOR NAME	DESCRIPTION
1	PhishWHO: phishing webpage detection via identity keywords extraction and target domain name finder	2016	Tan C.L. Chiew K.L. Wong K.	Proposes a phishing webpage detection approach four modules- identity keywords extraction, search engine lookup, target domain name finder, and three-tier identity matching.The target domain name and actual domain name are passed as inputs to the three-tier identity matching system to analyse the status of the query webpage.
2	Phishing-alarm: robust and efficient phishing detection via page component similarity	2017	Mao J. Tian W. Li P. et al.:	Proposed a phishing alarm by extracting the CSS features from the underlying architecture of the web page. Page similarity calculations are applied to the extracted features to classify the webpages

3	Off-the-hook: an efficient and usable client-side phishing prevention application	2017	Marchal S. Armano G. Gröndahl T. et al.	Designed a client-side phishing detection tool that offers better privacy, real-time protection, effective warnings, and resilience to dynamic phish. This approach uses a phish detector and target identifier mechanisms to detect the Phishing webpages.

2.2. ML-BASED WEBPAGE SIMILARITY EVALUATION

In this technique, HTML, extensible mark-up language (XML), JavaScript(JS), and CSS featuresare extracted from the source code of the webpage and are fed into ML algorithms for furtherclassification.

SI. NO	TITLE OF PAPER	YEAR OF PUBLICATION	AUTHOR NAME	DESCRIPTION
1	Cantina+ a feature-rich machine learning framework for detecting phishing web sites	2011	Xiang G Hong . Rose J. et al.: ‘	Proposed a content-basedapproach to detect webphishing by extracting URLfeatures, HTML- based features, and web- based features.The proposed approach is evaluated with twomethods that are randomised evaluationand time-basedevaluation using the Bayesian network.

2	Detecting phishing websites via aggregation analysis of page layouts	2018	Mao J. Bian J. Tian W.et al.:	Proposed a learning based layout - detection using ML algorithms. SVM and decision trees are used to classify the similarity of the webpages.
3	A new hybrid ensemble feature selection framework for machine learning-based phishing detection system	2019	Chiew K.L. Tan C.L. Wong K. et al.	Proposed a new feature selection framework for ML-based phishing detectionsystem. A novel cumulative distribution function gradient algorithm is designed as an automaticfeature cut-off rank identifier to produce the compact set of primary features and then dataperturbation, and function perturbation techniques are applied on these primary features to derive the hybrid ensemble features.
4	A machine learning based approach for phishing detection using hyperlinks information	2019	Jain A.K. Gupta B.B.	Proposed a novel web phishing detection approach by extracting hyperlinks of the web pages. The proposedapproach has extracted 12 specific hyperlink feature. The extracted features are then fed into ML algorithms such as naïve Bayes, random forest, SVM, Adaboost, neural network, C4.5, and logisticregression. The performance of all the ML

				algorithms was measured and reported.

3.HYBRID APPROACHES

Hybrid web phishing detection techniques were proposed by combining theexisting web phishing detection schemes.

SI. NO	TITLE OF PAPER	YEAR OF PUBLICATION	AUTHOR NAME	DESCRIPTION
1	A comprehensive and efficacious architecture for detecting Phishing webpages	2014	Gowtham R. Krishnamur thi I.:	Proposed a web phishingdetection approach usinga preapproved site identifier, login form finder, and ML algorithms. The websiteswhich are resulted as suspicious from the modules are furtherprocessed by the SVMML algorithm.
2	A stacking model using URL and HTML features for phishing webpage detection	2019	Li Y. Yang Z. Chen X. et al.	Combined URL features, HTML source code features, and HTML string embedding to detect theweb phishing scam. A stacking model of gradient boost decision tree, Xtreme Gradient Boost(XGBOOST), and LightGBM is used to improve the performance of the system.

3	Phishing website detection based on multidimensional features driven by deep learning	2019	Yang P Zhao . Zeng P	Presented a hybrid approach to attain multi-dimensional features to increase the detection rate and to reduce the detection time. URL evaluation, web page similarity approach, and contentbased approach are combined in that work. Both ML (i.e XGBOOST) and deep learning (i.e.CNN- LSTM) algorithms are applied to classify the attack.

4	Two level filtering mechanism to detect phishing sites using lightweight visual similarity approach	2019	Rao R.S. Pais A.R.	Proposed a two level filtering mechanism to detect the webphishing attack. At thefirst level, alightweight visual similarity-based blacklist is applied todetect near-duplicatephishing sites. At the secondlevel, heuristicfiltering is performed onthe bypassed phishing sites from the blacklists.
5	An approach for phishing validation and detection	2017	Li J.H. Wang S.D.:	Proposed a PhishBox approach forphish validation and detection. This approach has a two-stage model. In the first stage, theensemble model is designed to evaluate the phish data, and active learning is applied to reduce the cost of manual labelling. In the second stage, the validated phishing data is used to train the detection model.

2.1 Existing problem :

Cyber criminals use phishing emails because it's easy, cheap and effective. Email addresses are easy to obtain, and emails are virtually free to send. With little effort and cost, **attackers can quickly gain access to valuable data**.

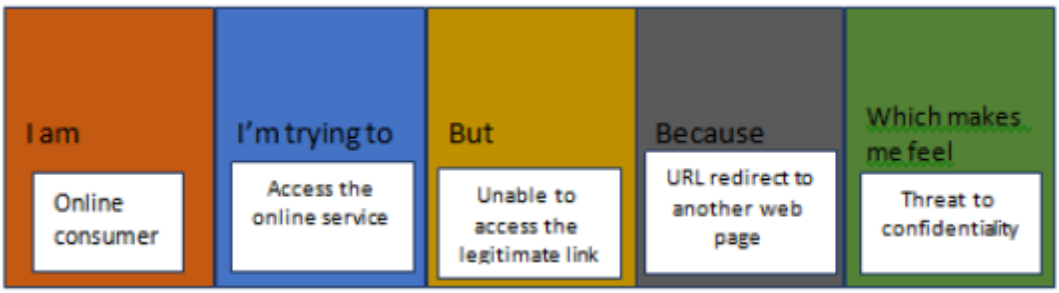
2.2 Problem Statement Definition :

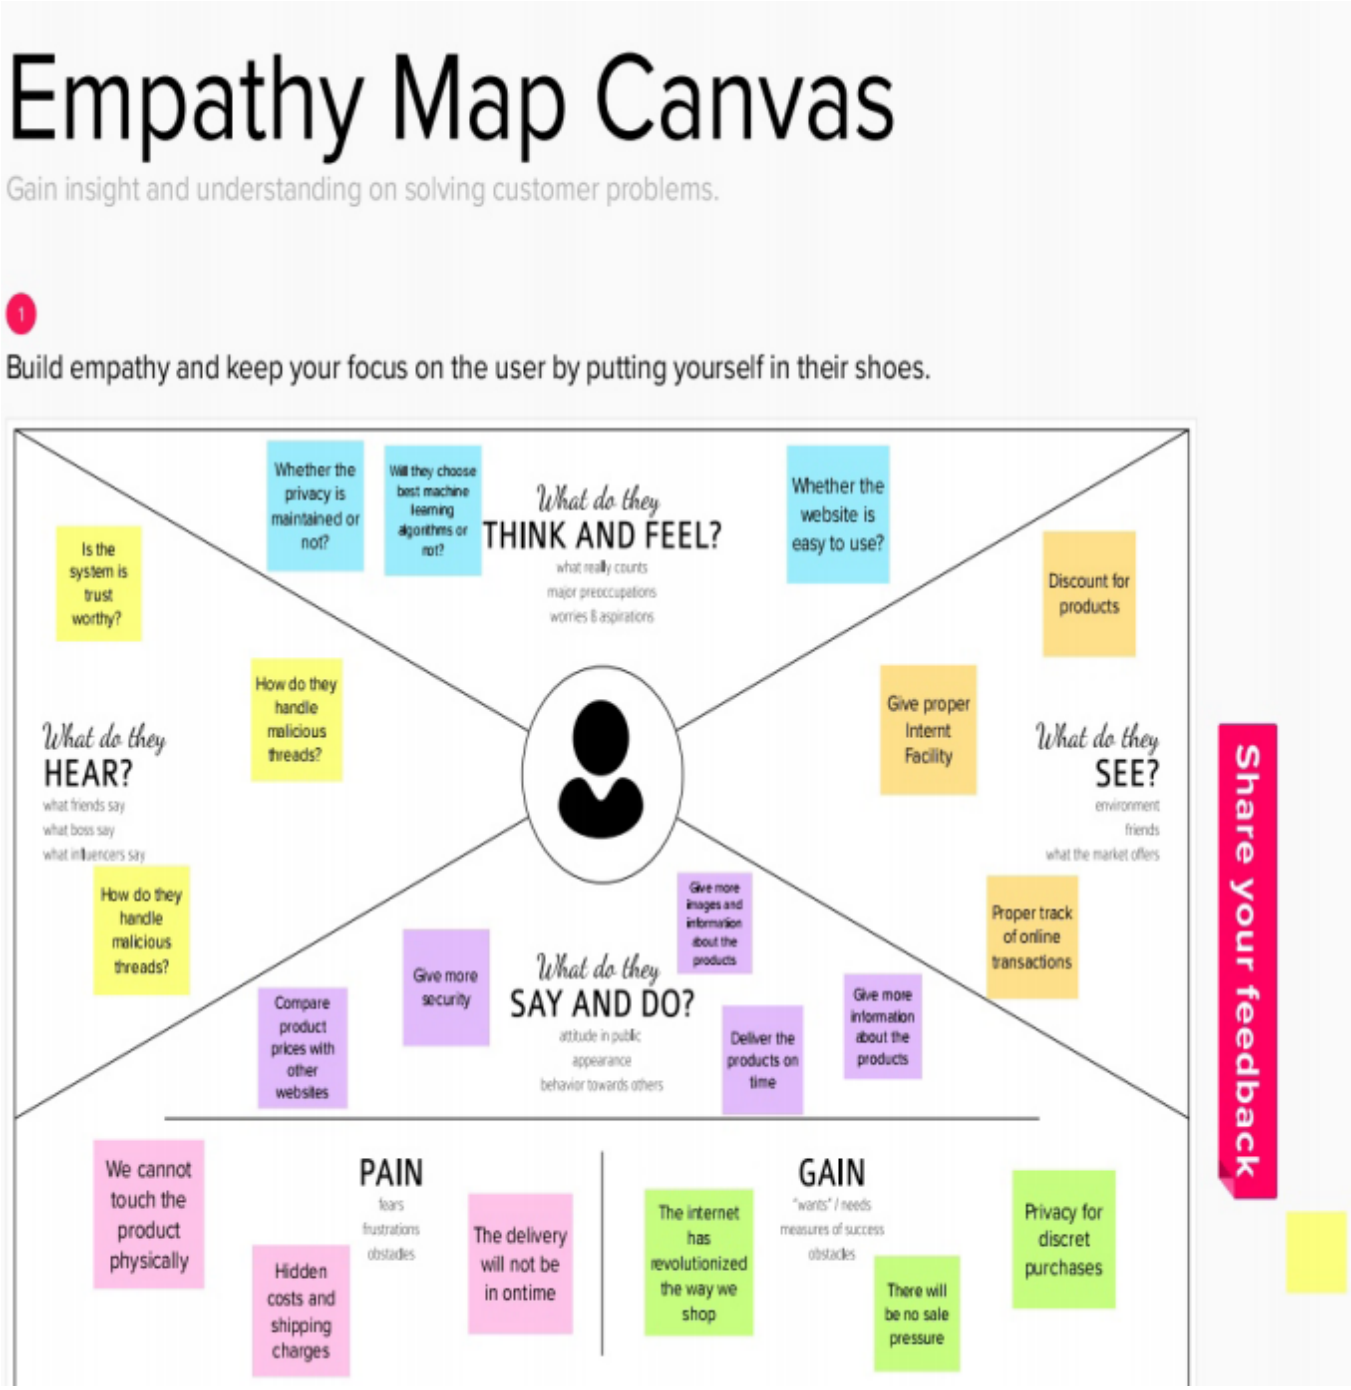
Malicious links will lead to a website that often steals login credentials or financial information like credit card numbers. Attachments from phishing emails can contain malware that once opened can leave the door open to the attacker to perform malicious behavior from the user's computer.



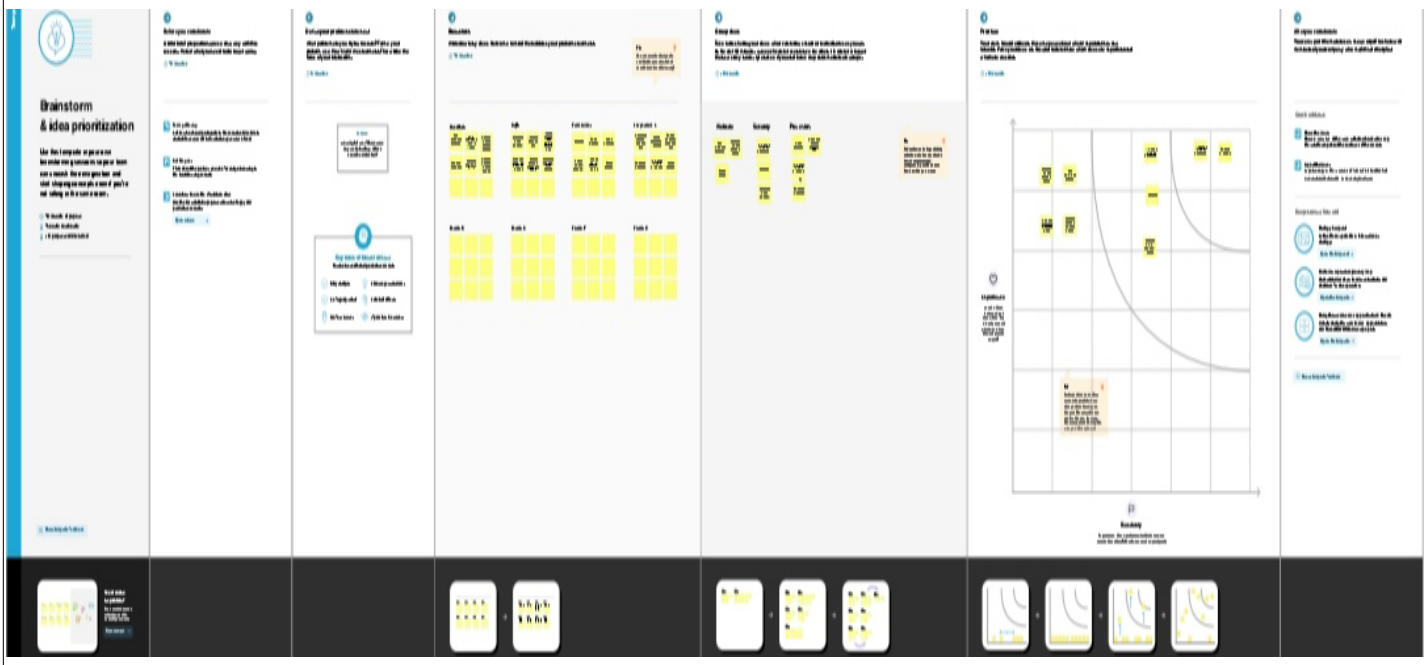
Problem Statement (PS)	I am (Customer)	I'mtrying to	But	Because	Which makes me feel
PS-1	Online consumer	Access the online service	Unable to access the legitimate link	URL redirect to another webpage	Threat to confidentiality
PS-2	Student	Apply for PAN card	Unable to access the legitimate link	URL redirect to another webpage	Insecure

3. IDEATION & PROPOSED SOLUTION:

3.1 Empathy Map Canvas:



3.2 Ideation & Brainstorming:



3.3 Proposed Solution

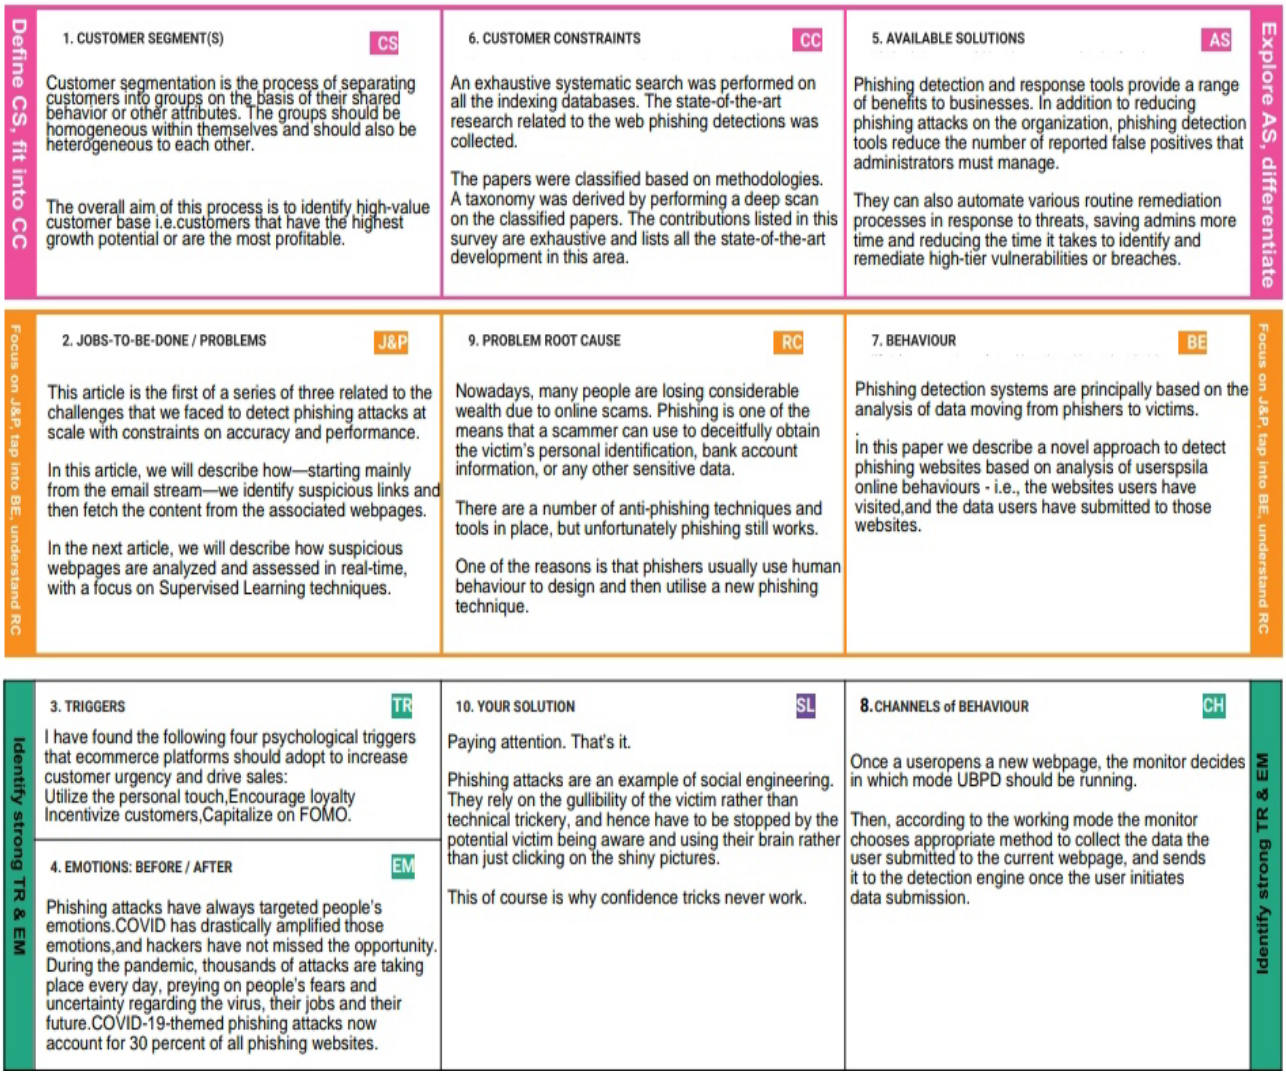
S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Attacker tries to steal your personal information and fools people to download malwares. Hackers build fake websites and send phishing emails that include links to those fake websites. They trick individuals for the theft of user data. Victims click on the link believing that it is legitimate and fill their personal information. The phisher steals the information and sells the stolen data or use it for other malicious information.
2.	Idea / Solution description	Database of URLs can be maintained as whitelist or blacklist. Use data mining algorithm to detect whether the website is phishing website or not. In ML , decision tree classifer help us to detect whether the URL is valid or not. Use two-factor authentication(2FA) on your important accounts.

3.	Novelty / Uniqueness	A novel approach to protect against phishing attacks at client side using auto -updated white-list. It combined the whitelist approach with heuristics and ML to propose the auto-updated whitelist. Blacklists and whitelists are used as a filtering module in many web phishing detection approaches to reduce the processing time wasted on pre- processing, feature extraction, and soon.
4.	Social Impact / Customer Satisfaction	This system can be used by many E-commerce or other websites in order to have good customer relationship. User can make online payment securely. Data mining algorithm used in this system provides better performance as compared to other traditional classifications algorithms. With the help of this system user can also purchase products online without any hesitation.
5.	Business Model (Revenue Model)	The 2020 Cyber Security Breaches Survey identified phishing attacks as the most disruptive form of cyberattack for UK businesses. For 67% of businesses, the single most disruptive attack in the last 12 months was a phishing attack. Phishing attacks can paralyse a business. Staff might be unable to continue their work. Data and assets might be stolen or damaged. Customers might be unable to access online services. Most businesses are able to restore operations within 24 hours. But in cases with amaterial outcome – including a loss of money or data – 41% of businesses take a day or more to recover.

6.	Scalability of the Solution	Whitelists can reduce false positives, improve performance, and reduce vulnerability to malware. However, whitelisting can belabor-intensive and time- consuming.Data mining is used in making better decisions, having a competitive advantage, and finding major problems. The Decision Tree algorithm is inadequate for applying regression and predicting continuous values.

3.1 Problem Solution fit

Project Title:Web Phishing Detection **Project Design Phase-I - Proposed Solution Fit**



4. REQUIREMENT ANALYSIS

4.1 Functional requirement:

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Features Extraction	Lexical Features. Hyperlink Features. URL Features. Textual content Features.
FR-2	Data Base Collection	Phishing URL's. Non-Phishing URL.
FR-3	Machine Learning Classifier Training	Identify the Criteria. Build a decision tree. Train our model. Evaluate our model. Check for false positives/negatives.
FR-4	Features Set Classification	Address Bar based Features. Abnormal Based Features. Domain Based Features. HTML & JavaScript Based Features.
FR-5	Algorithm	Data Mining Algorithm. PhishDekt Algorithm.
FR-6	Techniques	Whitelist & Blacklist Techniques. Layout Based Detection Schemes.

4.2 Non-Functional requirements:

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	The internet users can assistantiphishing tools and technology which provide essential information, such as warning of spoofed pages.
NFR-2	Security	The list-based detection will alert the users before entering into the phishing websites.
NFR-3	Reliability	Provide warning message to the users when it fails to detect the blacklisted URL are encountered with minor changes
NFR-4	Performance	The phishing websites can be detected with 97.95% Accuracy
NFR-5	Availability	Users can utilize the ML algorithm to detect attacks based on features extracted from URL
NFR-6	Scalability	ML based models is able to detect 0-day attacks which is scalable and accurate

5. PROJECT DESIGN

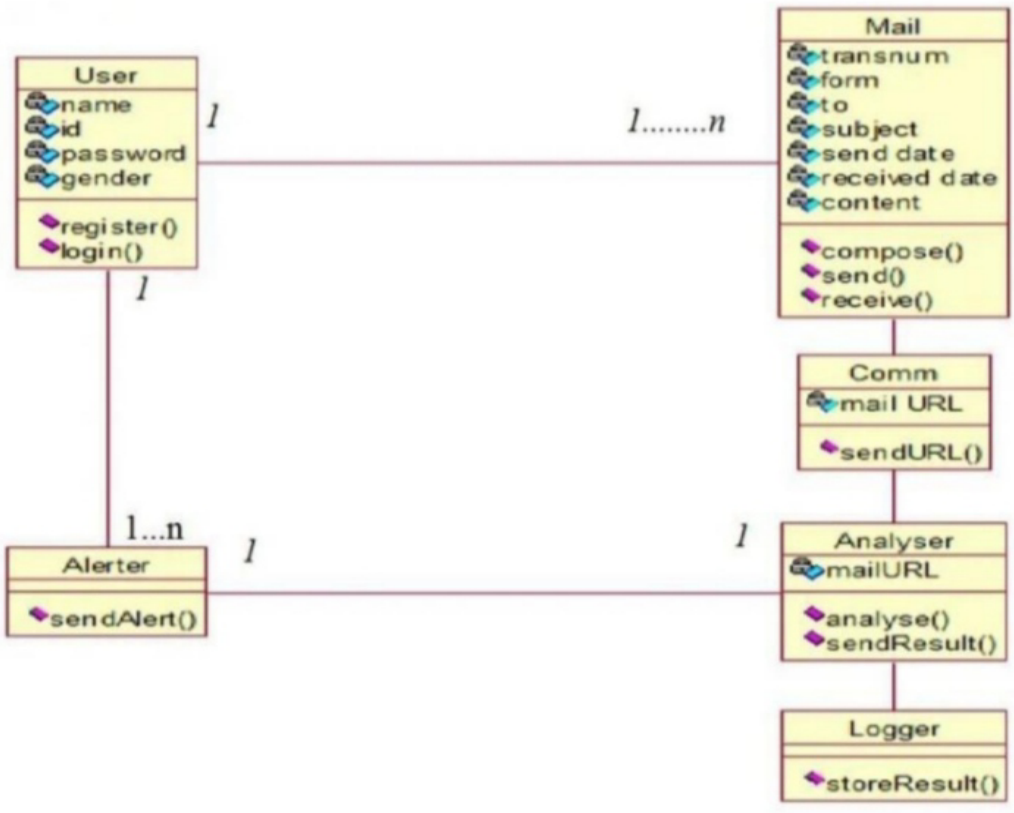
Processes are something that are often overlooked in our industry, but are absolutely

essential for a number of reasons.

They help you create a repeatable template for a winning formula.

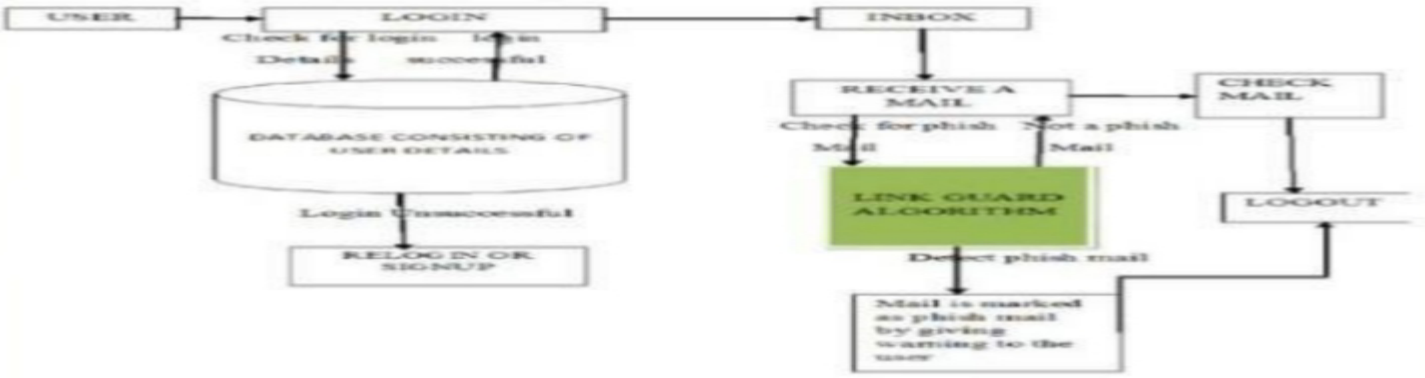
They help your team understand how to move through a project in the correct way.

5.1 Data Flow Diagrams:



5.2 Solution & Technical Architecture:

TECHNICAL ARCHITECTURE:



SOLUTION ARCHITECTURE:

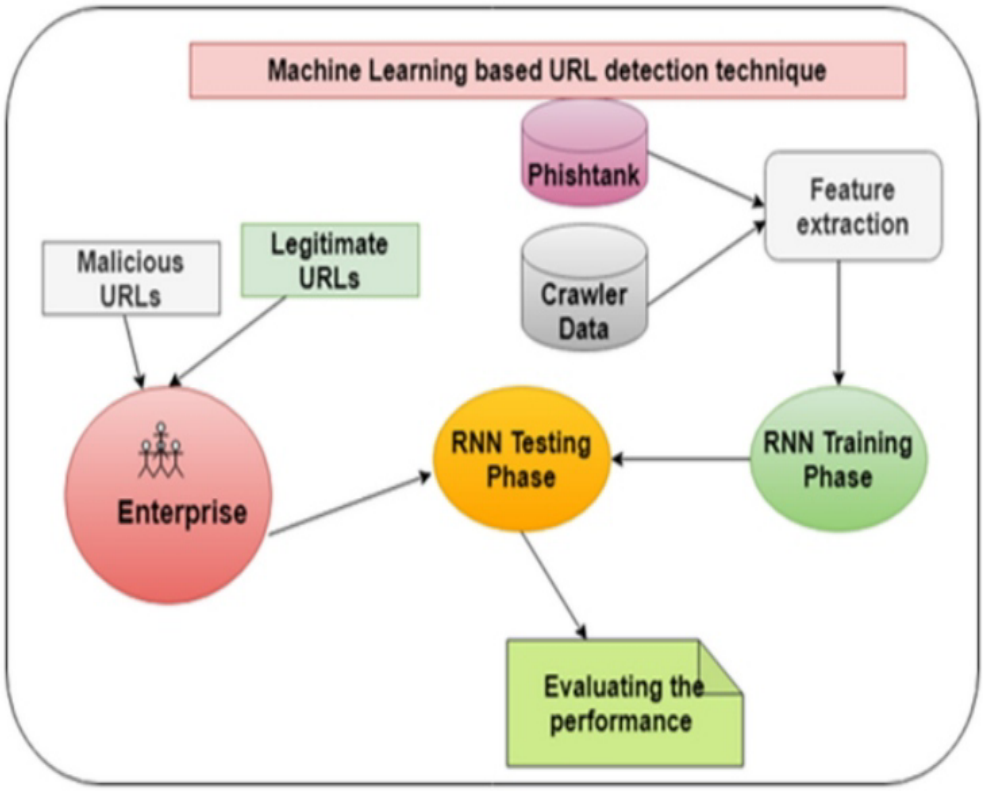


Table-1 : Components & Technologies:

S.No	Component	Description	Technology
1.	User Interface	How user interacts with application e.g.Web UI, Mobile App, Chat bot etc.	Web extension, JavaScript .
2.	Application Logic-1	Logic for a process in the application	Python/ Java
3.	Application Logic-2	Logic for a process in the application	IBM cloud , Flask server
4.	Database	Data Type, Configurations etc.	Hierarchical database, networkdatabase systems
5.	Cloud Database	Database Service on Cloud	IBM Watson
6.	File Storage	File storage requirements	IBM Cloud Storage or Other Storage Service or Local Filesystem
7.	Machine Learning Model	Purpose of Machine Learning Model	Decision Tree classifier, Regressionmodel, etc
8.	Infrastructure (Server / Cloud)	Application Deployment on Local System / CloudLocal Server Configuration: Cloud Server Configuration :	Local, Cloud Foundry, Kubernetes

Table-2: Application Characteristics:

S.No	Characteristics	Description	Technology
1.	Open-Source Frameworks	List the open-source frameworks used	Sniperphish, Gophish
2.	Security Implementations	List all the security / access controls implemented,use of firewalls etc.	Two factor authentication, Firewall
3.	Scalable Architecture	Justify the scalability of architecture (3 – tier,Micro-services)	Response time, Throughput
4.	Availability	Justify the availability of application (e.g. use ofload balancers, distributed servers etc.)	Auto scaling based on user demand
5.	Performance	Design consideration for the performance of theapplication (number of requests per sec, use of Cache, use of CDN's) etc.	Blacklist, Whitelist, ML techniques

5.3User Stories:

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Customer (Mobile user)	Registration	USN-1	As a user, I can register for the application by entering my email, password, and confirming my password.	I can access my account / dashboard	High	Sprint-1
		USN-2	As a user, I will receive confirmation email once I have registered for the application	I can receive confirmation email & click confirm	High	Sprint-1
		USN-3	As a user, I can register for the application through Facebook	I can register & access the dashboard with Facebook Login	Low	Sprint-2
		USN-4	As a user, I can register for the application through Gmail	I can register & access the dashboard with Gmail Login	Medium	Sprint-1
	Login	USN-5	As a user, I can log into the application by entering email & password	I can access my dashboard	High	Sprint-1
	Dashboard	USN-6	As a user, I can access the dashboard to get information	I can access my application	High	Sprint-1
Customer (Web user)	Registration	USN-7	As a web user, I can register my details in official websites and I will create strong passwords	I can access my dashboard/account safely	High	Sprint-1
	Login & Dashboard		As a web user, I can login into application by using my user id and password	I can access the resources	High	Sprint-1
Customer Care Executive	Login	CCE-1	As a CCE I can login to website using user id and password and I can interact with the user	I can access the website	High	Sprint-1
	Dashboard	CCE-2	As a CCE I can login to dashboard using user id and password and I can interact with the user and I can explain the app usage and rectify their issues.	I can access the resources	High	Sprint-1
Administrator	Login & Dashboard	A-1	As an administrator, I can access the dashboard and direct activities.	I will maintain the database safely	High	Sprint-1

6. PROJECT PLANNING & SCHEDULING

The definition of a sprint is a dedicated period of time in which a set amount of work will be completed on a project. It's part of the agile methodology, and

an Agile project will be broken down into a number of sprints, each sprint taking the project closer to completion.

6.1 Sprint Planning & Estimation:

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-1	Numpy, pandas, matplotlib, seaborn, Scikit learn.	USN-1	Collection of dataset and pre-processing the dataset.	20	High	Esther, Gayathri Priyadharshini, Merlin, Sakthi Eswari, Uma.
Sprint-2	Scikit learn.	USN-2	Building Machine learning model	20	High	Esther, Gayathri Priyadharshini, Merlin, Sakthi Eswari, Uma.
Sprint-3	Flask app, visual studio code-html,css, Anaconda prompt.	USN-3	Building an Application to integrate the model.	20	High	Esther, Gayathri Priyadharshini, Merlin, Sakthi Eswari, Uma.
Sprint-4	IBM cloud,IBM watson.	USN-4	Train the model on IBM.	20	High	Esther,Gayathri Priyadharshini,Merlin,Sakthi Eswari,Uma.

6.2.Sprint Delivery Schedule:

Project Tracker, Velocity & Burndown Chart:

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	20	6 Days	24 Oct 2022	29 Oct 2022	20	07Nov 2022
Sprint-2	20	6 Days	31 Oct 2022	05 Nov 2022	20	10 Nov 2022
Sprint-3	20	6 Days	07 Nov 2022	12 Nov 2022	20	15 Nov 2022
Sprint-4	20	6 Days	14 Nov 2022	19 Nov 2022	20	19 Nov 2022

Velocity:

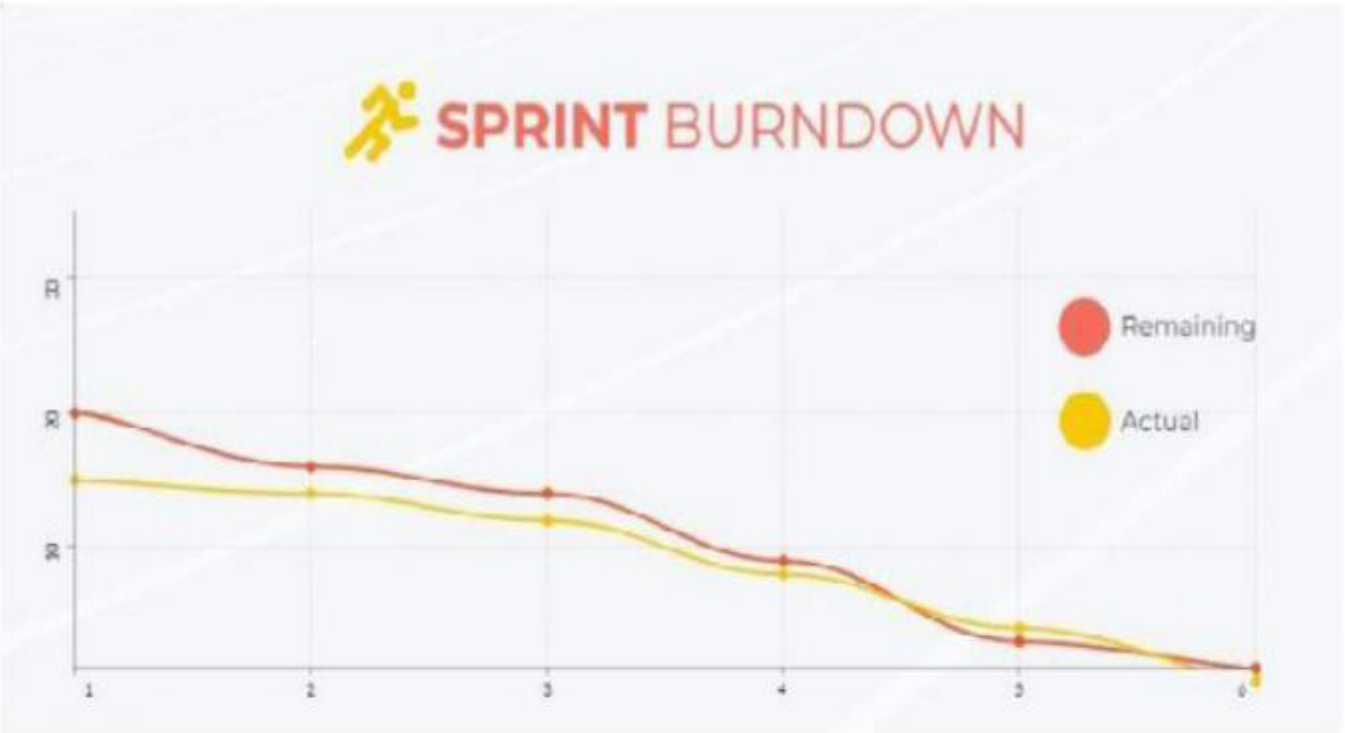
Imagine we have a 10-day sprint duration, and the velocity of the team is 20 (points per sprint). Let's calculate the team's average velocity (AV) per iteration unit (story points per day)

$$AV = \frac{sprint\ duration}{velocity} = \frac{20}{10} = 2$$

6.3.Reports from JIRA:

Burndown Chart:

A burn down chart is a graphical representation of work left to do versus time. It is often used in agile software
developmentmethodologies such asScrum. However, burn down charts can be applied to any project containing measurable progress overtime.



7.CODING & SOLUTIONING:

                Phishing is a form of fraud in which the attacker tries to learn
                sensitive information such as login credentials or account
                information by sending as a reputable entity or person in email or other
                communication channels.Phishing attacks can paralyze a business. Staff
                might be unable to continue their work. Data and assets might be stolen or
                damaged. Customers might be unable to access online services. The reason
                security defenders struggle

                to detect phishing domains is because of the unique part of the website
                domain.

8.TESTING

8.1 Test Cases

Test case ID	Feature Type	Component	Test Scenario	Pre-Requisite	Steps To Execute	Test Data	Expected Result	Actual Result	Status	Comments	TC for Automation(Y/N)	BUG ID
LoginPage_TC_001	Functional	Home Page	Verify user is able to see the landing Page when user can type the URL in the box		1.Enter URL and click go 2.Type the URL 3.Verify whether it is processing or not	https://phishingshield.herokuapp.com/	Should Display the Webpage	Working as expected	Pass		N	
LoginPage_TC_002	UI	Home Page	Verify the UI elements in Responsive		1.Enter URL and click go 2. Type or copy paste the URL 3. Check whether the button is responsive or not 4. Reload and Test Simultaneously	https://phishingshield.herokuapp.com/	Should Wait for Response and then gets Acknowledge	Working as expected	Pass		N	
LoginPage_TC_003	Functional	Home page	Verify whether the link is legitimate or not		1.Enter URL and click go 2. Type or copy paste the URL 3. Check the website is legitimate or not 4. Observe the results	https://phishingshield.herokuapp.com/	User should observe whether the website is legitimate or not.	Working as expected	Pass		N	
LoginPage_TC_004	Functional	Home page	Verify user is able to access the legitimate website or not		1.Enter URL and click go 2. Type or copy paste the URL 3. Check the website is legitimate or not 4. Continue if the website is legitimate or be cautious if it is not legitimate	https://phishingshield.herokuapp.com/	Application should show that Safe Webpage or Unsafe.	Working as expected	Pass		N	
LoginPage_TC_005	Functional	Home page	Testing the website with multiple URLs		1.Enter URL(https://phishingshield.herokuapp.com/) and click go 2. Type or copy paste the URL to test 3. Check the website is legitimate or not 4. Continue if the website is secure or be cautious if it is not secure	1. google.com 2. snprice.com	User can able to identify the websites whether it is secure or not	Working as expected	Pass		N	

8.2User Acceptance Testing

UAT Execution & Report Submission

1. Purpose of Document

The purpose of this document is to briefly explain the test coverage and open issues of the [Web Phishing Detection] project at the time of the release to User Acceptance Testing (UAT).

2. Defect Analysis

This report shows the number of resolved or closed bugs at each severity level, and how they were resolved

Resolution	Severity 1	Severity 2	Severity 3	Severity 4	Subtotal
By Design	10	4	2	3	20
Duplicate	1	0	3	0	4
External	2	3	0	1	6
Fixed	10	2	4	20	36
Not Reproduced	0	0	1	0	1
Skipped	0	0	0	0	0
Won't Fix	0	0	2	1	3
Totals	23	9	12	25	60

3. Test Case Analysis

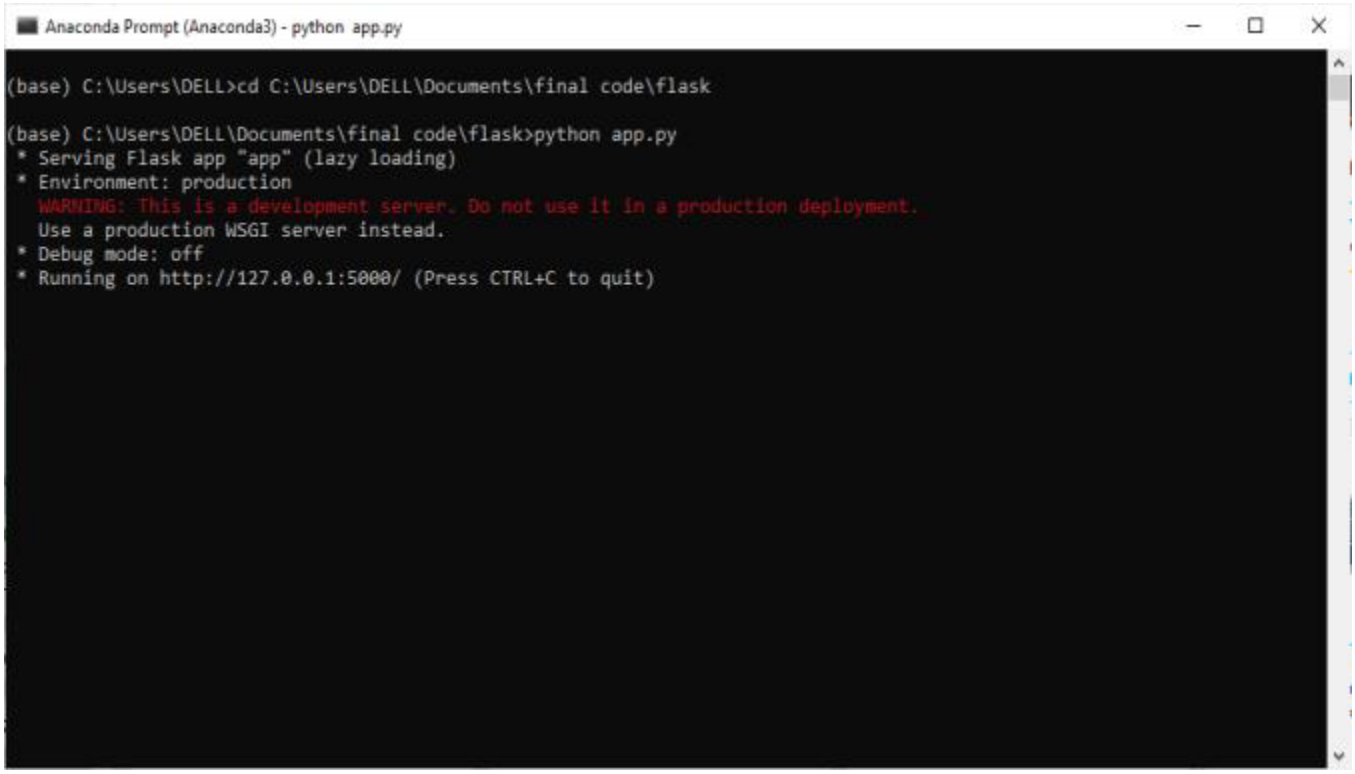
This report shows the number of test cases that have passed, failed, and untested

Section	Total Cases	Not Tested	Fail	Pass
Print Engine	10	0	0	10
Client Application	50	0	0	50
Security	5	0	0	4
Outsource Shipping	3	0	0	3
Exception Reporting	10	0	0	9
Final Report Output	10	0	0	10
Version Control	4	0	0	4

9. RESULTS

9.1Performance Metrics

ANACONDA PROMPT



10.ADVANTAGES & DISADVANTAGES

Advantages:

Blacklists:

- Requiring low resources on host machine
- Effective when minimal FP rates are required.

Heuristics and visual similarity:

- Mitigate zero hour attacks.

Machine Learning:

- Mitigate zero hour attacks.
- Construct own classification models.

Disadvantages:

. Mitigation of zero-hour phishing attacks.
. Can result in excessive queries with heavily loaded servers
. Higher FP rate than blacklists
. High computational cost.
. Time consuming.
. Costly.
. Huge number of rules

11.CONCLUSION

Education awareness is the most significant strategy to protect users from phishing attacks. Internet users should be aware of all security recommendations made by

professionals. Every user should also be taught not to mindlessly follow links to websites where sensitive information must be entered. Before visiting a website, make sure to check the URL. In the future, the system could be upgraded to

automatically detect the webpage and the application's compatibility with the web

browser. Additional work can be done to distinguish fraudulent webpages from authentic webpages by adding certain additional characteristics.

12.FUTURE SCOPE

Phishing is a considerable problem differs from the other security threats such as intrusions and Malware which are based on the technical security holes of the

network systems. The weakness point of any network system is its Users. Phishing attacks are targeting these users depending on the trikes of social engineering.

Despite there are several ways to carryout these attacks, unfortunately the currentphishing
detection techniques cover some attack vectors like email and fake websites. Therefore,
building a specific limited scope detection system will not provide complete protection from the wide phishing attack vectors
